O QUE PUBLICAMOS?

- +1.500 periódicos = +6 milhões de artigos!
 - Artigos publicados a partir de 1997
- 20.000+ livros online
- 2000+ Obras de referência (Reference Works)
- 17 Current Protocols (Laboratory Manuals featuring over 10,000 protocols)
- 946 Arquivos de periódicos (journals publicados antes de 1997)

WILEY

Periódicos

Acesso via Portal CAPES

- +1.170 periódicos
- +4 milhões+ artigos
- Conteúdo desde 1997
- +800 sociedades
- Acesso 24/7

Keywords:

protein flexibility; PDZ domain; docking; selectivity; ROSETTALIGAND

Abstract

Modeling of protein binding site flexibility in molecular docking is still a challenging problem due to the large conformational space that needs sampling. Here, we propose a flexible receptor docking scheme: A dihedral restrained replica exchange molecular dynamics (REMD), where we incorporate the normal modes obtained by the Elastic Network Model (ENM) as dihedral restraints to speed up the search towards correct binding site conformations. To our knowledge, this is the first approach that uses ENM modes to bias REMD simulations towards binding induced fluctuations in docking studies. In our docking scheme, we first obtain the deformed structures of the unbound protein as initial conformations by moving along the binding fluctuation mode, and perform REMD using the ENM modes as dihedral restraints. Then, we generate an ensemble of multiple receptor conformations (MRCs) by clustering the lowest replica trajectory.

Asymmetric Synthesis

☐ **A General Strategy for the Synthesis of P-Stereogenic Compounds**

Dr. Olivier Berger and Prof. Jean-Luc Montchamp

Article first published online: 9 SEP 2013 | DOI: 10.1002/anie.201306628

A great leap forward toward the general synthesis of P-stereogenic compounds: Heating H_3PO_2 with (–)-menthol and paraformaldehyde gives easily crystallized menthyl hydroxymethyl-*H*-phosphinate (**1**). From this product, virtually any P-stereogenic compound can be synthesized (see picture).
